

FOLIATION

Foliation combines the textures of slate, sandstone, and quartzite, making it ideal for use on the base of high-rise buildings or as a feature wall in indoor entryways.

The material is hard, with vivid colors and rich textures, and it boasts qualities such as compression resistance, wear resistance, fire resistance, frost resistance, corrosion resistance, and low water absorption. The variety of light and dark tones makes it suitable for European, Japanese, and Chinese architectural designs.
